EDUCATION

FUMEC

2020 - present

B.A. in Information Systems (Not finished yet)

AWARDS & CERTIFICATIONS

- Zend Certified PHP Engineer
- Hackathon winner (London 2017)
- Top Github trend developer

SKILLS

- Poliglot developer (go, python, ruby, PHP, Lua, swift, elixir)
- Cloud Architect (AWS, GCP)
- Advanced Cache Skills
- Kubernetes, Docker, Terraform
- English and Portuguese

PROFILE

With a background spanning ecommerce, ETL, API development, video and audio streaming, CDNs, and external service integrations, I specialize in translating complex technical requirements for both technical and non-technical teams. I thrive on versatility, fostering collaborative environments that nurture creativity and achieve collective goals through teamwork. My contributions to the open-source community have garnered recognition, supporting developers globally and enhancing their capabilities. Feel free to reach out for a chat or collaboration; I'm always eager to explore new ideas and technologies.

WORK EXPERIENCE

STAFF SOFTWARE ENGINEER

Globo

November 2016 - Present - Rio de Janeiro - Brazil

Globoplay is Brazil's largest OTT platform, with over 30 million subscribers, delivering both on-demand and live content. GloboCDN is renowned for its scalability, capillarity, and performance, particularly during major events like the FIFA World Cup and the Olympic Games. My daily job primarily focuses on GloboCDN, but I am also involved in building multiple teams and organizing initiatives for the video delivery platform. My responsibilities include maintaining a media delivery ecosystem and evolving the CDN. Additionally, I support other teams' objectives and assist in organizing the roadmap based on team capacity.

Our stack includes technologies such as Go, Python, Elixir, Ruby, Nginx, Lua, Kubernetes, Terraform, and GCP.

SENIOR SOFTWARE ENGINEER

LinCare

June 2016 - Santiago - Chile

As part of Startup Chile's 15th generation, I led the development of services to integrate an IoT wearable for monitoring the elderly into a big data environment. We used cutting-edge technologies like Go, Python, and Spark integrated with AWS Kinesis and Redshift to create streaming processing apps, robust ETL processes, and powerful APIs capable of handling thousands of reqs per minute. Additionally, we worked with various AWS cloud services such as DynamoDB, SNS, and Lambda. It was a rich experience allowing me to explore innovation in a multicultural and international setting.
